                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc and/or nerve tissue growth or regeneration, for wound healing, tissue crepair and replacement and in the treatment of wounds, incisions and culcers. Other uses include in the treatment of central and peripheral cc ulcers. Other uses include in the treatment of central and peripheral cc diseases and Shy-Drager syndrome, and mechanical and traumatic disorders, such as spinal cord disorders, head trauma and stroke. The proteins may class be used as a contraceptive, and for treating cogulation disorders such as haemophilias. The protein and nucleotide sequences with cadherin cactivity are useful for treating cancer. Other uses for the protein cc include for inhibiting the growth, infection of unction of, or killing, cc infectious agents such as bacteria, virus, fungi and other parasites, for ceffecting bodily characteristics such as height, weight, hair colour, cc effecting biorhythms or cardiac cycles or rhythms, effecting metabolism, anabolism, processing, utilization, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, cofactors, ceffecting behavioural characteristics, providing analgesic effects and corrected the protein and protein and protein of contents of the protein of the protein and protein cofactors, contents and protein contents and con

Primer sets for synthesizing polynucleotides, particularly the 5602 fullength cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length particularly the 5602 full-1 for the detection and/or

Claim 8; SEQ ID NO 17949; 2537pp + Sequence Listing; English

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: CC (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at place of the complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence complementary to a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence complementary to a polynucleotide which comprises at least 15 nucleotides; or (b) a combination of the 5'-end sequence is sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and COMAS easily without any specialised methods. AAH03166 to AAH13632 represent colligonucleotides, all of which are used in the exemplification of the COMAS collections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers ests can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cold sequences; and AAH13639 to AAH13632 represent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH13632 expresent human anino acid sequences; and AAH13639 to AAH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Primer sets for synthesizing polynucleotides, particularly the 5602 full-
length cDNAs defined in the specification, and for the detection and/or
diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 2221 BP; 591 A; 573 C;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    or to map gene positions. The proteins can be used in the treatment of immune deficiencies and disorders, such as severe combined immunedeficiency (SCID), as well as viral, bacterial, fungal and other infections. These infections include human immunodeficiency virus (HIV), hepatitis, herpesviruses, mycobacteria, Leismania spp., malaria and candidiasis. The proteins can be used to treat autoimmune disorders such as connective tissue disease, multiple sclerosis, systemic lupus erythematosis, rheumatoid arthritis, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune thyroiditis, insulin dependent diabetes mellitus, myasthenia gravis, graft-versus-host-disease and autoimmune inflammatory eye disease. The proteins can also be used to treat allergic conditions, such asthma. AAA16698 to AAA16774 represent probes for the human secreted proteins from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAA16618 to AAA16697 encode the human secreted proteins given in AAY94898 to AAY94980, isolated from human adult brain, adult thyroid, adult retina, foetal kidney, adult placenta, adult testis, whole embryo, adult cartilage, kidney, foetal brain, adult thymus, foetal placenta, adult uterus, adult tumour, and adult bladder, cDNA libraries. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and enimals. The polynucleotides can be used as markers for tissues in which the protein is preferentially expressed, as molecular weight markers on southern gels, and as chromosome markers for tags to identify chromosomes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Merberg I

(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes nucleic acids encoding PRO secreted and transmembrane proteins used therapeutically. The PRO proteins have cytostatic, anti-inflammatory, anti-proliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses
                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 12;

The present invention describes sixty four human PRO proteins which can CC be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for CC proteins, and diagnosing immune related disorders. The disorders are CC selected from systemic lupus erythematosus, rheumatoid arthritis, costeoarthritis, juvenile chronic arthritis, spondyloarthropathies, CC systemic selectosis, idiopathic inflammatory myopathies, Sjogren's CC syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic consenia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, CC anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, CC immune-mediated renal diseases, demyelinating diseases of the central and CC peripheral nervous systems, hepatobiliary diseases, inflammatory bowel CC disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune CC disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune CC diseases of the lung, and transplantation associated diseases including CC represent PCR primers and hybridisation probes used in the isolation of thuman PRO sequences. AAC58679 to AAC58642 and AAB33471 to AAB33477 CC represent human PRO polynucleotide and protein sequences given in the CC exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The membrane-bound proteins can also be employed for screening of pertial peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources

                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to 59 human secreted proteins and the nucleotide concerned the proteins and their encoding nucleotide sequences encoding them. Sequences AAC597845 and AAB34687-B34745 crepresent the proteins and their encoding nucleotide sequences, and creations exhibit neuroprotective, dermatological, immunosuppressive, creating their virucide, and fungicide activity. The proteins and creation research. The proteins are useful for treating immune deficiency and disorders, which may be genetic or resulting from infections, autoimmune conclusionates such as anaemias by regulating from infections, autoimmune confidences such as anaemias by regulating haematopoiseis. The proteins creating myeloid or lymphoid cell deficiencies such as anaemias by regulating haematopoiseis. The proteins creation and creation and revertissue growth or regeneration, for wound healing, tissue crepair and replacement and in the treatment of wounds, incisions and contraces. Other uses include in the treatment of wounds, incisions and contraces of the subject of treating coagulation and peripheral contraces and hampathilas. The protein and mechanical and traumatic disorders such as shaemophilias. The protein and mechanical and traumation disorders such as sanabolism, anabolism, processing, untilization, storage or elimination of cateforting bodily characteristics such as height, hair colour, catebolism, anabolism, processing, untilization, storage or elimination of distary fat, lipid, protein, carbohydrate, vitamine, minerals, cofactors, effecting behavioural characteristics; providing analgesic effects and cofactors and contracteristics and represents and an activities and cofactors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the
complementary strand of a polynucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
coligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprises a 3'-end sequence complementary to a
coligonucleotide which comprises a 3'-end sequence, where the
coligonucleotide comprises at least 15 nucleotides and the combination of
the 5'-end sequence's'-end sequence is selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              27-AUG-1999;

                                                                                                                                                                                                                                                                              The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostratic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and NA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful resgents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF63300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Grimaldi

New isolated PRO polypeptide and encoding nucleic acid, useful for the diagnosis and treatment of disorders associated with the PRO polypeptisuch as AIDS, cancer, atherosclerosis, inflammatory disease and diabet

and diabetes

Claim 12; Fig 32; 178pp; English

```
The invention relates to an isolated PRO polypeptide (a'secreted or, CC transmembrane protein) comprising: (a) at least 80% sequence identity or CC positives when compared to any of 15 sequences, fully defined in the Specification, lacking or with its associated signal peptide; or (b) at CC cleast 80% sequence identity to a sequence encoded by the full-length CC coding sequence of a DNA deposited in the American Type Culture CC comprising: (a) at least 80% sequence encoded by the full-length CC comprising: (a) at least 80% sequence identity to a nucleotide sequence that encodes a PRO protein; (b) at least 80% sequence lentity to a nucleotide sequence or full-length coding sequence with any of 15 fully defined sequences of 957-3441 base pairs, given in the specification; or (c) at least 80% sequence identity to a full-length coding sequence of a CC DNA deposited under ATCC Accession No. 209526, 209529, 209524, 209528, CC 209530, 209523, 209492, 209531, 209531, 209529, 209524, 209528, CC 209531 or 209619; (2) a vector comprising the nucleic acid; (3) a host CC cell comprising the vector which, when cultured under conditions suitable for expression of the PRO polypeptide, produces the PRO protein; (4) a CC chimeric molecule comprising PRO fused to a heterologous amino acid sequence; and (5) an anti-PRO antibody. The methods and compositions of the present invention are useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS (acquired compositions), cancer, atherosclerosis, inflammatory cdisease, diabetic complications, cardiac injury and organ failure. The biological assays. The present sequence represents a PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 100.0%;

CC polypeptides are useful in detecting PRO polypeptide. The PRO CC polypeptides are useful in detecting PRO polypeptides in a sample, in CC linking a bioactive molecule to a cell expressing a PRO polypeptide, and CC in modulating at least one biological activity of a cell expressing a PRO polypeptide, and CC useful for treating cardiac insufficiency disorders. PRO1184 and PRO1186 CC stimulate adrenal cortical capillary endothelial growth, and PRO1186 CC PRO343, PRO828, PRO826, PRO1068 or PRO535, PRO826, PRO8197, PRO1186 CC PRO343, PRO828, PRO826, PRO1068 or PRO535, PRO826, PRO819, PRO1128, CC PRO343, PRO828, PRO826, PRO1068 or PRO535, PRO826, PRO819, PRO1128, CC PRO343, PRO828, PRO826, PRO1068 or PRO535, PRO826, PRO819, PRO1128, CC PRO343, PRO828, PRO8137 induce c-fos in endothelial cells, and are thus useful for treating conditions or disorders where angiogenesis would be beneficial, e.g. wound healing and antagonist of this polypeptide are condothelial growth factor (VEGP) stimulated proliferation of endothelial cells growth in the properties of the properties of the properties of the properties of the proliferation of cells, PRO1346, PRO1346,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The invention discloses isolated PRO secreted/transmembrane polypeptides CC comprising a sequence without signal peptide and the nucleic acid CC encoding them. The polypeptides can be used to raise antibodies that CC specifically bind to the PRO polypeptide, for linking a bioactive cone biological activity of a cell. The PRO polypeptide or modulating at least CC one biological activity of a cell. The PRO polypeptides or polymentides are also useful in gene therapy, in chromosome CC polypucleotides are useful as molecular markers for protein electrophoresis, and the isolated nucleic acids may be used for recombinantly expressing CC those markers. The PRO polypeptides and nucleic acids may be used in diagnostic assays for tissue typing. Anti-PRO antibodies are useful in diagnostic assays for CC PRO, and in affinity purification of PRO from recombinant cell culture or natural sources. The sequences presented in ABU60478-ABU60624 are the PRO CC polynucleotides of the invention. Note: The sequence data for this patent CC is also available in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bioactive molecules to cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for for dentifying agonists or antagonists. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in the generation of antisense RNA and DNA, chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout animals, to construct hybridisation probes for mapping the gene which encodes the PRO polypeptide, and for the genetic analysis of individuals with genetic disorders, in gene therapy, for chromosome clentification, as chromosome markers, and for generating probes for PCR, Northern analysis, Southern analysis and western analysis. ABU13860-ABU14006 represent the human PRO polypeptides of the invention. Note: The

                                                                                                                                                                                                                                                          The invention relates to a human secreted and transmembrane polypeptide (PRO) and the polynucleotide encoding it. The PRO polypeptide or polynucleotide is useful in pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating cancers, inflammatory diseases, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS) and diabetic complications in mammals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or rabbits. The sequences are also useful in biotechnological and medical research and in various industrial applications. Sequences ABU60230-ABU60245 represent human PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Baker KP,

N-PSDB; 2003-352829/33. DB; ACA64519.

New genes PRO184), u Barcoma, s and secreted and transmembrane polypeptides (e.g. PRO183 or useful for treating or diagnosing e.g. ovarian cancer, Kaposi leukemia, lymphoma, hepatitis B, multiple sclerosis or Crohn' 0

Claim 12; 663pp; English.

The invention describes a new isolated nucleic acid molecule comprising the full length coding sequence of the DNA deposited with the American CType Culture Collection (e.g. ATCC Deposit NO. 209521, 552-PTA, 819-PTA, CC 209439, 203135, etc); or a sequence with at least 80% identity to a DNA CC encoding a PRO polypeptide. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These CC encers (e.g. ovarian cancer, colorectal cancer, Kaposi's sarcoma, CC encers (e.g. ovarian cancer, colorectal cancer, Kaposi's earcoma, CC disease in mammals. The PRO polypeptides are useful in drug screening, CC particularly as targets for therapeutic intervention in these diseases, CC end in the diagnostic determination of the presence of these diseases. CC The PRO polypeptides are also useful as molecular weight markers, or for CC chromosome identification. The PRO genes are useful as hybridisation CC probes, or for screening libraries of human cDNA, genomic DNA or mRNA. CC The PRO genes may also be used in gene therapy, particularly for creplacing a defective gene. This is the amino acid sequence of a novel buman correted and transmembrane pon columnatida. secreted and transmembrane PRO polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid encoding a secreted/
CC transmembrane polypeptide (designated as PRO proteins). 15 PRO
CC polypeptides and their encoding polypucleotides are disclosed. Also
CC included are a vector comprising the PRO nucleic acid, a host cell
CC comprising the vector, a process for producing a PRO polypeptide (by
CC culturing the host cell under conditions for the expression of the PRO
CC polypeptide, and recovering the PRO polypeptide from the cell culture, an
CC isolated polypeptide having at least 80% amino acid sequence identity to
CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a
CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a
CC the PRO. The PRO nucleotide sequences are useful as hybridisation probes,
CC in chromosome and gene mapping, in generating sense and antisense RNA or
CC the development and screening of therapeutically useful reagents, and in
CC the development and screening of therapeutically useful reagents, and in
CC gene therapy. The polypeptides may be used as molecular weight markers
CC for protein electrophoresis purposes. The PRO polypeptides and nucleic
CC acids may also be used for chromosome identification, and tissue typing.
CC syndrome. Other PRO proteins are variously implicated in immune
CC disorders, inflammatory disease, organ failure, atherosclerosis, cardiac
CC injury, infertility, birth defects, premature aging, cardiac injury,
CC a PRO accer and diabetic complications. The present sequence represents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated nucleic acids and their encoded PRO proteins. The PRO polypeptides are useful in diagnosing and treating a condition that is responsive to the PRO polypeptide, e.g., in the treatment of sports-related joint problems, articular cartilage defects, osteoarthritis, rheumatoid arthritis and cancer. The PRO polypeptides are also useful in identifying agonists antagonists of the PRO polypeptide. The nucleic acid is useful as hybridisation probe, in chromosome and gene mapping, and in the generation of anti-sense RNA and DNA. The present sequence represent the maino acid sequence of a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         organ failure, atheroscles

                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a new isolated nucleic acid molecule comprising the full length coding sequence of the DNA deposited with the American CYppe Culture Collection (e.g. ATCC Deposit No. 20962; 552-PTA, 819-PTA, CC 209439, 203135, etc); or a sequence with at least 80% identity to a DNA CE encoding a PRO polypeptide. The PRO polypeptides or polymucleotides are useful as pharmacuticals, diagnostics, biosensors or bioreactors. These CC are particularly useful for detecting or treating e.g. malignancies or cancers (e.g. ovarian cancer, colorectal cancer, Kaposi's sarcoma, CC leukaemia or lymphoma), hepatitis B, multiple sclerosis, or Crohn's CC disease in mammals. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases. CC The PRO polypeptides are also useful as molecular weight markers, or for Cromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This is the amino acid sequence of a novel way.

                                                                                         CC transmembrane polypeptide (designated as PRO proteins). 15 PRO polypeptides and their encoding polynucleotides are disclosed. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, a process for producing a PRO polypeptide (by culturing the host cell under conditions for the expression of the PRO culturing the host cell under conditions for the expression of the PRO polypeptide, and recovering the PRO polypeptide from the cell culture, an isolated polypeptide having at least 80% amino acid sequence identity to the PRO polypeptides, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence and an antibody which specifically binds to PRO. The PRO nucleotide sequences are useful as hybridisation probes, in chromosome and gene mapping, in generating sense and antisense RNA or DNA, in generating transgenic or knock-out animals which can be used in the development and screening of therapeutically useful reagents, and in gene therapy. The polypeptides may be used as molecular weight markers for protein electrophoresis purposes. The PRO polypeptides and nucleic acids may also be used for chromosome identification, and tissue typing. PRO241 (identified as Chordin) is a candidate gene for Cornelia de Lange syndrome. Other PRO proteins are variously implicated in immune constraints, inflammatory disease, organ fallure, atheroselerosis, cardiac alpury, infertility, birth defects, premature aging, cardiac injury, alpos orotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 200

The invention discloses isolated PRO secreted/transmembrane polypeptides CC comprising a sequence without signal peptide and the nucleic acid CC encoding them. The polypeptides can be used to raise antibodies that CC specifically bind to the PRO polypeptide, for linking a bioactive CC molecule to a cell expressing a PRO protein and for modulating at least CC one biological activity of a cell. The PRO polypeptides or CC polypucleotides are also useful in gene therapy, in chromosome CC identification, as chromosome markers, or in generating probes. The PRO CC polypeptides are useful as molecular markers for protein electrophoresis, CC and the isolated nucleic acids may be used for recombinantly expressing CC those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for CC natural sources. The sequences presented in ABU60478-ABU60624 are the PRO CC polypucleotides of the invention. Note: The sequence data for this patent CC is also available in electronic format from USPTO at

and el isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 PRO1375, which stimulate proliferation of stimulated T-lymphocytes therapeutically useful for enhancing immune response and in cancer

Claim 12; Fig 328; 648pp; English.

The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in linking a bioactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insufficiency disorders. PRO1154 and PRO536, stimulate adrenal cortical capillary endothelial growth, and PRO536,

Initial Residue Gaps mammals which would be beneficial in inhibiting tumour growth. PR0826, CC PR01068, PR01184, PR01184 and PR01375 stimulate proliferation of ctimulated T-lymphocytes and are therapeutically useful for enhancing cc immune response. PR0828, PR0826, PR01068 or PR01132 enhance survival of retinal neurons cells (PR01132 is also enhances survival/proliferation of crod photoreceptor cells) and therefore are useful for treating retinal cc disorders of injuries, e.g. retinitis pigmentosum, AMD. PR0819, PR0813 and PR011066 induce proliferation of mammalian kidney mesangial cells, and PR011066 induce proliferation of mammalian kidney mesangial cells, and PR011066 induce proliferation such as Berger disease or other ceresed mesangial cell function such as Berger disease or other cephropathies associated with dermatitis, herpetiformis or Crohn's cdisease. PR01310, PR0844, PR01312, PR01192 and PR01387 induce the coroliferation and/or redifferentiation of chondrocytes in culture and are thus useful for treating sports injuries, and arthritis. This is the cc amino acid sequence of a novel human PRO protein EAŚPGSSSQGSVPENQYGLPFEKWLLIGSLLFGVLFLVIGLVLLGRILSESLRRKRYSRLDYLINGIYVDI 370 380 390 400 410 420 X

The methods ecompositions of the present invention are useful for the diagnosis and treatment of disorders such as inflamentory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications and mutations in general. This is the amino acid sequence of a novel human secreted PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 431 AA;

DE Human secreted/transmembrane protein PRO361.

Human; PRO; secreted protein; transmembrane protein; anti-HIV; cytostatic; antiarteriosclerotic; antiinflammatory; antidiabetic; cardiant; AIDS; acquired immunodeficiency syndrome; cancer;

```
The invention relates to an isolated PRO polypeptide (a secreted or CC transmembrane protein) comprising: (a) at least 80% sequence identity or CC positives when compared to anny of 15 sequences, fully defined in the CC specification, lacking or with its associated signal peptide; or (b) at least 80% sequence identity to a sequence encoded by the full-length CC coding sequence of a DNA deposited in the American Type Culture CC collection (ATCC). Also included are: (1) an isolated nucleic acid CC comprising: (a) at least 80% sequence identity to a nucleotide sequence that encodes a PRO protein; (b) at least 80% sequence with any of 15 fully CC (c) at least 80% sequence of a full-length coding sequence of a cC (c) at least 80% sequence identity to a full-length coding sequence of a cC (c) at least 80% sequence identity to a full-length coding sequence of a cC (c) at least 80% sequence identity to a full-length coding sequence of a cC (c) at least 80% sequence comprising No. 209528, 209528, 209528, 209529, 209528, 209528, 209529, 209528, 209528, 209529, 209528, 209528, 209529, 209528, 209529, 209528, 209529, 209528, 209529, 209528, 209529, 209528, 209529, 209528, 209529, 209528, 209529, 209529, 209528, 209529, 209528, 209529, 209528, 209529, 209528, 209529, 209529, 209528, 209529, 209529, 209528, 209529, 209529, 209528, 209529, 209529, 209528, 209529, 209529, 209529, 209528, 209529, 209529, 209529, 209528, 209529, 209529, 209528, 209529, 209529, 209528, 209529, 209529, 209529, 209528, 209529, 209528, 209529, 209529, 209528, 209529, 209528, 209529, 209528, 209529, 209528, 209529, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209528, 209

Sequences AAC5988-C5988 and AAB34687-B34745 CC represent the proteins and their encoding nucleotide sequences, and CC sequences AAB34746-B34771 represent fragments of the proteins. Probes for the DNA sequences are represented by sequences AAC5984-C59596. The CC proteins exhibit neuroprotective, dermatological, immunosuppressive, CC antiinflammatory, antianaemic, nootropic, antiparkinsonian, creenbroprotective, haemostatic, vulnerary, cytostatic, antipsoriatic, antipsoriatic, antiparkinsonian, creenbroprotective, haemostatic, vulnerary, cytostatic, antipsoriatic, antipsoriatic, antiparkinsonian, creenbroprotective, haemostatic, vulnerary, cytostatic, antipsoriatic, antiparkinsonian, creenbroprotective, haemostatic, vulnerary, cytostatic, antipsoriatic, antipsoriatic, antiparkinsonian, creenbroprotective, haemostatic, vulnerary, cytostatic, antipsoriatic, antiparkinsonian, creenbroprotective, haemostatic, vulnerary, cytostatic, antipsoriatic, and for treating from infections, autoimmune deficiency, and for treating from infections, autoimmune deficiency, and multiple selerosis, systemic lupus erythmatosus, repeated and architic, and for treating myeloid or lymphoid cell candor nerve tissue growth or regeneration, for wound healing, tissue repair also useful in compositions for browneds, incisions and culters. Other uses include in the treatment of wounds, incisions and culters. Other uses include in the treatment of wounds healing, tissue repair and replacement and in the treatment of central and peripheral concerns and springer syndrome, and mechanical and traumatic disorders, such as spinal cord disorders, head trauma and stroke. The protein may complete the protein seasons and for treating coagulation disorders such as heamophilias. The protein and nucleotide sequences with cadherin called for inhibiting the growth, infection or function of or killing, infecting backless and shapency fat, lipid, protein, cathody
